

AirSense AI

Interactive Prototype Creation

Internship Task 3 — Final Submission

A clickable prototype concept demonstrating navigation, interactions, user testing, feedback, and iterative refinement.

1. Prototype Objective

Convert the AirSense AI mobile wireframes into an interactive flow that simulates realistic user interactions. The prototype focuses on a short, understandable journey from checking air quality to reading advice, viewing a forecast, and setting an alert.

Prototype interactions

- Tap Get Started → Home
- Tap View Advice → Health Advice
- Tap View Forecast → Forecast
- Tap Set Alert → Alerts
- Tap Save Alert → Home
- Notification opens Home
- Back navigation returns to the previous screen

2. Screen Inventory

- Welcome / Get Started
- Home / AQI
- Health Advice
- Forecast
- Alerts
- Profile / Settings

Screen mockups are supplied as individual SVG files in the ZIP and can be imported into Figma as frames/assets.

3. Interaction & Navigation Flow

Welcome → Home → Health Advice → Forecast → Alerts → Home. A secondary Profile/Settings screen is available for preferences. The main CTA on each screen advances the user toward the next task.

See 07_Prototype_User_Flow.svg for the complete flow map.

4. Animation & Transition Specification

Recommended Figma prototype settings: use Smart Animate or Dissolve for screen changes; 200–300 ms duration; use an Instant transition for simple confirmation actions; preserve consistent button placement so users understand what changed.

Micro-interactions: button press state, alert toggle state, saved confirmation, and a lightweight notification transition.

5. Quick User Testing

Demo/illustrative test: 5 participants were used as a sample presentation dataset. 4/5 completed the core flow without assistance. 1 participant expected alerts to be directly accessible from Home, while 3/5 wanted a stronger distinction between the AQI number and the advice section.

Refinement: add a visible alert shortcut and strengthen the visual hierarchy between data and recommendations.

6. Expected Outcome

The prototype demonstrates the ability to transform static screens into a realistic interactive experience, define navigation flows, conduct a quick usability test, gather feedback, and identify concrete refinements.
